ABSTRACT

This research focuses on the 1989, 1990 and 1991 utilization statistics of Silas B. Hays Army Community Hospital. These statistics are evaluated including and excluding the active duty Army and their dependents. These personnel are the principal users of the facility and are expected to be transferred/relocated to Fort Lewis when Fort Ord closes. This thesis forecasts utilization for 1992 and growth rate statistics for the remaining personnel at Fort Ord and in the Monterey peninsula area. This analysis determines whether local area hospitals can support the expected medical requirements of the remaining personnel. A regular trend forecasting analysis was used to predict upcoming year statistics. The data are broken down by armed forces to determine primary usage by individual service (Army, Navy, Air Force, Marine Corps, and Coast Guard). Conclusions on adequacy of hospital coverage for users are based on Silas B. Hays Army Community Hospital historical inpatient and outpatient clinical patronage. No financial data were considered in this research. Based on the data and analysis the research supports closing Silas B. Hays Army Community Hospital as other area hospitals have sufficient capacity to accommodate residual Fort Ord and Monterey peninsula patients. It was noted in the research that several other areas should be considered before a final decision is made.

I. INTRODUCTION

As the Soviets forces pull back, the phenomenal changes in eastern Europe have reduced demands and need for federal spending on defense. Secretary of Defense Dick Cheney stated during a October 1990 news conference that the changes in the nature of the threat and the realities of the budget simply means that our defense budgets are going to be leaner in the years ahead (FY 90 DoD budget totalled \$293.0 billion expected to decrease to \$277.9 billion by FY 95). Repercussions from the easing of Soviet relations in Europe and the growing national deficit have placed considerable pressure on the Department of Defense (DoD) to trim its personnel missions and weapons systems. Another facet of this changing environment is the cold, hard reality that extensive base closing will be a fact of life in the coming years [Ref. 1]. This has resulted in the proposed closure and realignment of more domestic military bases. In support of the Fiscal Year 1992-93 President Budget the DoD submitted a plan to eliminate or close a total of 86 domestic bases and 139 overseas sites [Ref. 2]. This is described as one U.S. largest military reduction programs ever undertaken. The commission estimated that the savings projected to be incurred from this evolution would total \$693.6 million a year in operating costs and \$5.6 billion over 20 years. "We cannot responsibly reduce the defense budget without looking at bases...", Secretary of Defense Dick Cheney said at a 29 January defense budget briefing [Ref. 1]. The President and Congress called for the closing of seven major army posts (Fort McClennan, Fort Benjamin Harrison, Fort Devens, Fort Dix, Fort Chafee, Fort Smith, Sacramento Army Depot and Fort Ord) and the realignment or reduction of forces at ten other installations.

Fort Ord, located outside Monterey, California, was included on this latest list of bases proposed for closure or realignment. The base closure proposals will be approved by Congress prior to their implementation during the 1992-97 time-frame. During this same period, the active duty Army will be reduced from 18 to 12 divisions (FY 95), and total manpower cut by almost 30 percent (FY 87-95 net reduction of 245,000 Army personnel; total DoD military net reduction of 521,000 personnel) [Ref. 3]. The number of Army and Air Force personnel would be reduced in 1991 to its lowest level in 40 years. The closure of Fort Ord closure has been expected because of the Force Realignment Plan announced in 1990. According to this plan the 199th Brigade will relocate to Fort Polk to support the light infantry training operations. This will allow space for the 7th Infantry Division "Light" to relocate at Fort Lewis [Ref. 4]. The total economic effect the closure of Fort Ord will have on the Monterey Peninsula and surrounding areas is beyond the scope of this thesis research. This research will focus on one sector of the closure of Fort Ord, the potential loss of Silas B. Hays Army Community Hospital and the potential impact to military personnel, dependents and retired personnel remaining in the area.

A. OBJECTIVES

The focus of this thesis is the closure of Silas B. Hays Army Community Hospital located on Fort Ord Army Base in Monterey, California. The objectives are as follows:

1. Study the medical services provided by Silas B. Hays Army Community and the primary users of these services.
2. Examine the local area hospitals (Natividad Medical Center, Salinas Valley Memorial Hospital and Community Hospital of the Monterey Peninsula) and compare their services to that of Silas B. Hays Army Community Hospital.

3. Determine whether the Monterey Peninsula can handle the increased medical requirements expected if Silas B. Hays Army Community Hospital is closed.

4. Provide alternatives to Silas B. Hays Army Community Hospital closure.

B. THE RESEARCH QUESTION

This thesis will address two primary questions:

1. If Silas B. Hays Army Community Hospital is closed, does the Monterey Peninsula have the medical capability and/or facilities to service the remaining armed forces, dependents and retired personnel residing in the area?

2. What alternatives for obtaining medical care are available to the remaining armed forces, dependents and retired personnel if Silas B. Hays Army Community Hospital is closed?

C. SCOPE, LIMITATIONS AND ASSUMPTIONS

The basic area of impact for Silas B. Hays Army Community Hospital is limited to Monterey County and the medical service responsibility (catchment) area of the hospital. The impacted military installations in the county include the Naval Postgraduate School and tenant commands, the Presidio of Monterey and Fort Hunter Liggett Military Reservation.

Inpatient/Outpatient data were supplied by Silas B. Hays Army Community Hospital Patient Administration Office. Assumptions involved in individual calculations are described with relevant calculations in Chapter III.

Silas B. Hays Army Community Hospital 1990 inpatient/outpatient statistics (Table I) and the six clinics used in generating the 1990 outpatient data (Table II) are listed below:

TABLE I
SILAS B. HAYS ARMY COMMUNITY HOSPITAL 1990
INPATIENT OUTPATIENT STATISTICS

Branch of Svc	Inpatient Monthly Avg (Range)	Outpatient Monthly Avg (Range)
Army	1,450 (1,030 - 2,013)	37,471 (25,243 - 45,794)
Navy	68 (23 - 122)	3,053 (1,593 - 3,732)
Marine Corps	36 (0 - 119)	573 (253 - 1,352)
Air Force	53 (20 - 158)	1,448 (764 - 1,805)

Primus (Salinas)	2584.3
Primus (Presidio)	4563.5
TOTAL	14,000.80

D. LITERATURE REVIEW AND METHODOLOGY

Two basic research methodologies were used: data collection and literature review. The literature review was conducted in three phases. First, sources cataloged by the Defense Logistics Studies Information Exchange were examined for relevant studies on base closures and economic impact. The bibliographic sources identified were next obtained along with recent articles in the field. Finally, local and federal government agencies were surveyed to obtain any relevant studies and current basic data. Primary data collection was made from the Association of Monterey Bay Area Governments, Defense Manpower Data Center and Silas B. Hays Army Community Hospital. Data on Fort Ord was also obtained through the Fort Ord Public Affairs Office.

II BACKGROUND

A. BASE CLOSURE PROCESS

The Defense Budget submitted for fiscal year 1991 was based on assumptions regarding troop reductions in Europe, which require a change in the United States' defense structure. Some forces will be removed from Europe and deactivated to reduce costs, and some will be restationed in the United States. The military bases located in the continental United States have been examined for full closure, partial closure or reduction/realignment. Fort Ord is currently earmarked for full closure. The Pentagon publicly assessed that only 312 of the domestic bases are truly essential [Ref. 5]. The resulting shutdowns will be the first large scale U.S. base closings since earlier in this decade, when Frankfort Arsenal in Philadelphia and Fort MacArthur in California were closed.

The base closure process is somewhat complicated. In the peaceful days, when the Department of Defense (DoD) Budget was ever increasing, closing an obsolete military base was rather a simple operation. Between 1961-77 the Pentagon disposed of hundreds of military installations by executive fiat. Today the Pentagon must submit costly, time consuming, environmental impact studies before any base can be closed. Such reviews, which include evaluating the local economic effect, became law in 1977. Obsolete bases exist in the military structure, where the mission is duplicated or efficient consolidation of resources have been accomplished. Military bases provide close to a million civilian jobs and millions of dollars in business for nearby areas. In the past, closing them has been a highly charged partisan issue with the political party in power targeting opponents' bases. This has led to the

establishment of a rigid, open and mutually accepted base closure process by Congress. The new procedure was agreed upon by all to preclude the "games" of previous base closure efforts. Under this procedure neither the Congress nor the President would have any ability to amend the list, although the Congress could pass a resolution rejecting the entire list.

The scenario was set when the House voted to clear a plan that should result in the closure of 86 military installations by 1995. The plan will affect 145 military installations. Of these, 86 will be fully closed, five partially closed and 54 would be either decreased or increased in units and activities. Only about 20 percent of the affected civilian and military jobs are anticipated to be lost, with 55,000 personnel being transferred from one base to another [Ref. 6].

In the 100th Congress, Rep. Arney introduced a bill (H.R.-4481) that would establish a commission to identify unneeded military bases and make recommendations. The commission and the established time frame for implementation were designed to make the base closure process a non-political issue. The bill was passed as part of the FY 89 Defense Authorization Bill.

The Defense Authorization Bill created a new base closure process involving an independent, outside commission, to permit base closures to go forward in a prompt and rational manner. Four areas will be briefly addressed: 1) Closure criteria, 2) DOD Proposed closure list, 3) Commission report and 4) Congressional Review.

Closure Criteria. On 31 December 1990, the Secretary of Defense published in the Federal Register and transmitted to Congress a list of criteria that served as the basis for analysis for closure and realignment decisions. The proposed list of criteria was subject to public comment. To select the bases to be closed, the 12-member commission visited dozens of

bases and pored over thousands of economic data. Basically the criteria for closing bases focused on bases that were no longer required for national defense. The data supporting this process were provided to the Commission by the Services. Installations with similar missions were grouped together to facilitate consistent analysis. The bases were then screened to determine whether the installations were appropriately sized to support current or future requirements and whether their physical attributes were appropriate to accomplish assigned mission. When it was determined that an installation's mission was impaired, the Commission looked at relocation alternatives. The review focuses on the ability of a receiving installation to accommodate and enhance the mission of the units or activities being relocated and whether the costs of the closure and realignment package could be paid back with savings in six years. On 15 February 1991, the Secretary submitted to Congress the final list of criteria, which was deemed effective unless Congress passed a joint resolution of disapproval by 15 March 1991.

DOD Proposed Closure List. The cutoff date for the Secretary of Defense to transmit to Congress and the Commission a proposed list of closure realignments was 15 April 1991. This list was also publicly released. The Commission held public hearings on the bases proposed list of closure or realignment. The Commission can only delete bases from the list if:

a. the Commission determines that the criteria were departed from (in a substantial way) in selecting a base for inclusion; or

b. the Commission determines that a base was selected for inclusion on the list based on improper factors (partisan politics).

Commission Report. On 1 July 1991 the Commission reported to the President its findings. The Commission report went to the President who had until 20 August 1991 to approve it.

Congressional Review. The base closures and realignments contained in the Presidentially approved Commission report can be implemented beginning 45 days after the day on which the list is submitted to Congress.

The base closure and realignment agreement also includes two key provisions: 1) DOD must ensure that property made excess will be environmentally restored as promptly as possible, 2) DOD must ensure that bases not formally recommended for closure would not suffer a reduction in mission, personnel, or resources.

As the work of the commission comes to an end, the task of the Pentagons Office of Economic Adjustment (OEA) is just beginning. In 1961, Secretary of Defense Robert McNamara, created the OEA to address the local economic effects of base closings involving the loss of 220,000 military/civilian positions from 1961-1968. The Defense Economic Adjustment Program was later strengthened by creating the President's Economic Adjustment Committee (EAC). The EAC process permits the federal government to speak with one coordinated voice for the benefit of the affected community without creating a new bureaucracy. The community adjustment program does not focus solely on the base but on a broad range of community improvements, retraining programs, small business & industrial financing programs, affordable housing, transportation access, and water-sewage capacity to make the community more attractive and competitive [Ref. 7].

To assist the communities effected by base closures three bills were introduced by the House of Representatives in 1988 (H.R.- 2852, H.R.- 101 and H.R.-699). The House proposed this legislation to assist in the economic stability and community development of municipalities affected by such closures.

H.R.- 2852, "Economic Diversification and Defense Adjustment Act", established an Economic Diversification and Defense Adjustment Council. The council will allocate financial resources to communities that would be severely economically affected by base closures/reductions in military contracts. It places a \$200 million spending limit on its programs and would be financed by general revenues.

H.R.- 101, "Defense Adjustment Economic Act," requires any defense facility with 100 or more workers to set up an alternative use committee. This committee would be responsible for coming up with plans to convert defense facilities into non-defense use facilities.

H.R.- 699, "Economic Conversion Act of 1989," focuses on dealing with unemployment provisions after contracts for defense workers had been lost [Ref. 8].

Base closures inevitably save the government money when accompanied by job reductions, deactivation of military activities, and to a lesser extent reduced purchases of goods and services.

B. FORT ORD ARMY BASE

Fort Ord is located on 28,057 acres of plains/hills in central California's Monterey County. Total population is approximately 38,895 which represents 11 percent of Monterey County (1990 population of 367,590). Fort Ord is the largest single community on the Monterey peninsula. It provides employment for approximately 19,581 civilian and 15,792 military personnel. The annual payroll of Fort Ord is approximately \$500 million dollars and 65 percent of the retail customers in the Monterey and Seaside area are associated with the military. Ten to twenty percent of the Monterey County real estate home buyer market is from the Fort Ord military/civilian population [Ref. 9].

The major missions of Fort Ord are:

1. Train the 7th Division and associated non-division troop units for wartime missions.
2. Provide support and services on the installation to accomplish the above.
3. Command, plan, budget and support all activities at Presidio of Monterey and Fort Hunter Liggett.
4. Support all Army activities in California south of San Jose to include support for U.S. Army Reserve Centers.
5. Support National Guard and Army Reserve units in the area as required.
6. Upon mobilization, process, train and deploy reserve component units, and transform Fort Ord into a training center.
7. Support other services and retirees as required.

Fort Ord supports two subposts which are located near the base. The Presidio of Monterey located a few miles away on the knoll in the city of Monterey, and about 80 miles away is Fort Hunter Liggett, in a rural and isolated inland training area. The Presidio is the home of the Defense Language Institute, Foreign Language Center whose mission is to provide foreign language instruction in support of national security requirements. Fort Hunter Liggett is a major maneuver area for the 7th Infantry Division (Light) and other active and reserve component elements and is the site of a field laboratory for the U.S. Army TEXCOM Experimentation Center whose mission is to provide decision makers with scientifically valid data to help decide how the Army of the future should be organized, equipped and trained to fight.

Fort Ord became the new home of the 7th Infantry Division on 6 December 1972. Two years later, on 21 October 1974, the division was reactivated at Fort Ord as part of the Army plan

to increase its strength to sixteen combat units. Then early in 1984, as part of a plan to increase the strategic flexibility of the armed forces, the 7th Infantry Division was converted to a "Light" division. "Light" meaning a highly mobile, rapidly deployable, wholly air transportable, and a combat ready division when it reached the battle zone.

Several reasons have been offered for closing Fort Ord. One explanation is that the base is categorized as a single-use base (too small to accommodate anything but a light fighter infantry division). As defense spending and military manpower is decreased it is essential that the number of installations be reduced to get the greatest return from a declining Defense Budget. In an effort to reduce costs, the military is in favor of newer and larger installations that can serve a variety of roles. The range and training facilities at Fort Ord are restricted. The base is located in a high cost area. Closure of Fort Ord and movement of the 7th Infantry Division to Fort Lewis would reduce the costs of off-post housing and operations. Another reason offered for closing Fort Ord is its distance from a major airfield. The soldiers ride an average of four hours in convoy to commercial airports or a military airfield in San Francisco. By transferring the 7th Infantry Division "Light" to Fort Lewis, Washington this problem would be rectified since the existing airfields (McChord Air Force Base, Washington) can handle the expected airlift capacity. A deployment from Fort Lewis would make travel faster and logistically easier. A major financial reason for the Fort Ord closing is the estimated \$70 million dollars in savings expected to be realized [Ref. 10]. The total full base closure program is expected to have an annual savings of \$700 million [Ref. 11].

C. SILAS BEACH HAYS ARMY COMMUNITY HOSPITAL

Silas B. Hays Army Community Hospital is the largest medical facility on the Monterey Peninsula. Built in 1972 the hospital has 440 beds and includes 32 specialty clinics and full patient facilities. The primary mission of the hospital is to provide personalized care to active duty personnel, their dependents and retired personnel. Table III provides a list Silas B. Hays Army Community Hospital's patrons:

TABLE III
SILAS B. HAYS ARMY COMMUNITY HOSPITAL 1990 PATRON CHART

NAME	MILITARY/CIVILIAN
Fort Ord	14,994/22,217
Presidio of Monterey	3,723/ 1,913
Naval Postgraduate School	2,173/957
Fort Hunter Liggett	392/624
Active duty family members	0/30,837
Retired personnel	0/19,491
Retired personnel fam. mbrs.	0/29,236
TOTAL	21,282/105,275

The current medical staff of Silas B. Hays consist of 75 physicians and 75 nurses. The total number of personnel assigned to Silas B. Hays is 1,148 (includes doctors, nurses, dental technicians, enlisted and civilian personnel).

Silas B. Hays Army Community Hospital uses the Defense Enrollment Eligibility Reporting System (DEERS) to determine who is eligible for direct health care and who qualifies for the Civilian Health and Medical Program of the Uniformed Services (CHAMPUS - the government shares with service families the cost of health care from civilian hospitals and

doctors). DEERS establishes a means of getting immediate confirmation of those eligible for health care.

CHAMPUS cost coverage reported for Silas B. Hays Army Community Hospital from January 1990 through December 1990 was \$12,160,630 (this includes both government and patient cost). The total cost to the government during this period was \$9,567,472. This cost is not totally inclusive because claims for CHAMPUS are accepted after December 1990. The cost of CHAMPUS is expected to rise if the hospital closes, due to the simple fact that more service members will have to seek medical support from civilian hospital facilities vice using a government facility.

Silas B. Hays Army Community Hospital has extensive programs which provide professional assistance for psychological, emotional and social problems. In addition to the main hospital and troop medical facilities, Silas B. Hays Army Community Hospital has two Primary Care of Uniformed Services (PRIMUS) clinics (Presidio of Monterey & Salinas) that provide outpatient care free of charge to eligible personnel.

The following medical services are not provided by Silas B. Hays Army Community Hospital: Blood Transfusion Center, Area Veterinary Lab, Physiatry, Adolescent Psychiatry, Electroneuromyography, Child Neurology, Radiation Therapy, Health Physics, Magnetic Resonance Imaging, Laser, Ocular Prosthesis, Blind Rehabilitation, Aural Rehabilitation, Fitting of Hearing Aids, Speech Pathology, Neurosurgery, Thoracic Surgery, Cardiovas (Open Heart & Not Open Heart), Plastic Surgery, Intervertebral Disc, Hand Surgery, Organ Transplant, Head & Neck, and Corneal Transplant. All of the above medical services are provided by Lettermen Army Hospital except Ocular Prosthesis and Blind Rehabilitation which are provided by the local area hospitals. The Adolescent

Psychiatry medical service can be found at both MEDDAC Lettermen and Irwin.

Silas B. Hays Army Community Hospitals General 1990 Utilization Statistics (Consolidated Information) are as follows:

A. Admissions:

Army	9,031
Navy	938
Marine Corps	144

Air Force	7,976
Coast Guard	706
Other	<u>817</u>
TOTAL	67,640
GRAND TOTAL	711,969

D. Surgeries:

Admissions - 2,157	Inpatient Visits - 710
Bed Days - 5,682	Outpatient Visits - 18,834

E. Births 1,465

F. Emergency Room Visits 33,682

The 1990 occupancy rate for Silas B. Hays Army Community Hospital was computed to be 22.7 percent. This calculation includes active duty Army and their dependents. However, if dependents were excluded the occupancy rate for Silas would drop to 7.28 percent. The primary reason behind the low occupancy rate is attributable to the large number of beds available versus the amount of beds used per year. The number of bed authorized at Silas B. Hays is 400, but it can expand to 630 on an emergency basis. See Appendix A for detailed occupancy rate calculations.

III. ANALYSIS

The data and information was collected and analyzed. The population of the remaining personnel was determined. The utilization statistics of three local hospitals (Community Hospital of the Monterey Peninsula, Natividad Medical Center, and Salinas Valley Memorial Hospital) are compared with Silas B. Hays Army Community Hospital to determine if their facilities can handle the increased patient load expected with the closure of Fort Ord. A forecasting model is derived to project the new utilization statistics of Silas B. Hays Army Community Hospital when the active duty Army personnel and their dependents are subtracted. A new occupancy rate is calculated. More pertinent utilization statistics are generated for the outpatient clinics (Fort Hunter Liggett, Occupational Health Clinic, Troop Medical Clinic, Clinic Presidio of Monterey, Primus Clinic of Salinas, and Primus Clinic of Monterey) and are displayed in various forms.

A. PROBLEM

The personnel at Fort Ord Army base currently totals approximately 55,000 military personnel, civilian employees and dependents, which represents 15 percent of the total population of Monterey County. The Silas B. Hays Army Community Hospital mission is to provide quality health care for the active duty military, dependents, retirees, and their families. The 7th Infantry Division (Light) is scheduled to relocate to Fort Lewis in 1995. The basic question this research will attempt to answer is "Where will the active duty military, dependents and retirees remaining in the area after the closure of Fort Ord receive medical support?" Table IV

lists the active duty military breakdown of personnel remaining in the area.

TABLE IV
ACTIVE DUTY PERSONNEL REMAINING IN MONTEREY AREA
(SILAS B. HAYS ARMY COMMUNITY HOSPITAL CATCHMENT AREA)

ARMED SERVICE	# REMAINING IN MONTEREY
Army	4,204
Navy	2,048
Air Force	850
Marine Corps	321
Coast Guard	132
TOTAL	7,555

The above data were derived by using the Silas B. Hays catchment area report (based upon the 40 mile radius rule) and DEERS.

The reservist breakdown of personnel remaining in the area are listed in Table V.

TABLE V
RESERVIST REMAINING IN MONTEREY AREA
(SILAS B. HAYS ARMY COMMUNITY HOSPITAL CATCHMENT AREA)

ARMED SERVICE	# REMAINING IN MONTEREY
Army	2,325
Navy	423
Air Force	264
Marine Corps	96
Coast Guard	26
TOTAL	3,134

Table V does not account for the reservists who travel to the area for drill duty.

The number of dependents, retirees and the retirees families remaining in the Monterey area are 13,799; 19,491 and 29,236 respectively. For these three categories the cumulative number of people remaining in the area is 62,526 (these calculations include family members residing at Presidio of Monterey, Fort Hunter Liggett and Off-Post as of 30 September 1990) [Ref. 12].

B. COMPARISON OF MONTEREY HOSPITALS

Civilian medical support in the Monterey area is handled primarily by three main hospitals: Community Hospital of the Monterey Peninsula (CHOMP), Salinas Valley Memorial Hospital and Natividad Medical Center. Each were evaluated as a potential source of medical support if Silas is recommended for full closure.

CHOMP began in 1927 as a hospital primarily for research into metabolic disorders and treatment of patients who suffer from them. It was later converted into a general community hospital in 1934 after experiencing financial difficulties. It was the first community hospital in the county to offer all private rooms, each with a window opening to the sylvan landscape of the Monterey Peninsula. The hospital expanded to 174 beds in 1971 which is where it remains today (there are an additional 26 beds, but they are a part of the Adult Chemical Dependency Department). The CHOMP medical staff consists of 199 people (77 medical specialists, 76 surgical specialists, and 46 other specialists). The hospital staff consists of 529 nursing personnel, 345 clinical personnel, and 519 support personnel (this represents full/part time personnel). The average total occupancy rate for CHOMP in 1989 was 83.7 percent.

CHOMP General 1990 Utilization Statistics are as follows:

A. Admissions:

Community Hospital	11,186
Recovery Center (chemical dependency)	<u>269</u>
TOTAL	11,455

B. Patient Days:

Community Hospital	51,729
Recovery Center	<u>5,807</u>
TOTAL	57,536

C. Outpatient Visits:

Community Hospital	129,406
Recovery Center	<u>1,530</u>
TOTAL	130,936

D. Surgeries:

Community Hospital	3,817
Recovery Center	<u>3,249</u>
TOTAL	7,066

E. Births 1,641

F. Emergency Room Visits 32,260

The 1990 occupancy rate for CHOMP was computed to be 81.5 percent a decline of 2.2 percent from the previous year. See Appendix B for calculations.

The average charge and expense per stay at CHOMP in 1990 were \$7,356 and \$5,170 respectively (average stay 4.7) [Ref. 13].

The Natividad Medical Center is strategically located in the northeast section of Salinas, has been serving the health care needs of the Monterey County for over 100 years. Founded 7 June 1886 as a 69 bed hospital, It has grown into a 211 bed full service hospital. Average total occupancy rate was 49.6 percent in 1989. The medical staff consists of 160

physicians, 300 nurses and a technical staff of 73 representing some 30 specialties.

The Natividad Medical Center General 1990 Utilization Statistics are as follows:

A. Admissions/Discharges:

Data includes the Extended Care Unit (newborns are excluded)	6,012
---	-------

B. Patient Days:

Natividad and the Extended Care Unit	40,638
--------------------------------------	--------

C. Outpatient Visits/Emergency Room Visits:

Natividad Medical Center	99,387
--------------------------	--------

The 1990 occupancy rate for Natividad Medical Center was computed to be 52.8 percent, an increase of 3.2 percent from the previous year. See Appendix B for calculations.

The average charge and expense per stay at Natividad Medical Center in 1990 were \$6,460 and \$4,982 respectively (average stay 6.5 days) [Ref. 14].

The Salinas Valley Memorial Hospital was founded in 1953 as a dedication to World War II. It is a 229 bed comprehensive medical center. The average total occupancy rate was 62.8 percent in 1989. The current medical staff consist of 240 Physicians, Nurses, Clinical Personnel, Podiatrists, Dentists, and Psychologists.

Salinas Valley Memorial Hospital General 1990 Utilization Statistics are as follows:

A. Admissions:

Adults and Pediatrics (newborns are excluded)	10,659
--	--------

B. Patient Days:

Adults and Pediatrics (newborns are excluded)	50,064
--	--------

C. Outpatient Visits:

Salinas Memorial Hospital	76,049
---------------------------	--------

(This data includes the following areas:

Lab, Cat Neurology, EKG, Echo, Radiology, Ultra-Sound, Cat Scan, Respiratory, Physical Therapy, MRI, and Occupational Therapy).

D. Surgeries:

Includes Outpatient Surgery	7,787
-----------------------------	-------

E. Births	1,973
-----------	-------

F. Emergency Room Visits	27,756
--------------------------	--------

The 1990 occupancy rate for Salinas Valley Memorial Hospital was computed to be 59.9 percent a decline of 2.9 percent from the previous year. See Appendix B for calculations.

The average charge and expense per stay at Salinas Valley Memorial Hospital in 1990 were \$9,314 and \$5,579 respectively (average stay 5.1) [Ref. 15].

The goal of this thesis is to compare the services at the above hospitals with Silas B. Hays Army Community Hospital in an attempt to systematically distribute the required medical services to maintain the medical support military members are accustomed to receiving.

The clinical/medical services provided by CHOMP, Natividad Medical Center and Salinas Valley Memorial Hospital directly comparable to the ones at Silas B. Hays Army Community Hospital. Therefore, personnel remaining in the local area will be able to receive the same clinical treatment provided by Silas B. Hays.

C. FORECASTING MODEL

This research and data collection were conducted based upon the assumption that current usage of the Silas B. Hays

Army Community Hospital would remain stable. Therefore, seasonal demand trends have already been taken into consideration (excluded are the Army active duty personnel and their dependents transferring when Fort Ord Army Base closes). The data collected and the forecasts performed exclude the above members and are based on recorded hospital utilization statistics (calendar year 1988 through September 1991 statistics were used). The utilization statistics were used to forecast calendar year 1992 Admissions and Bed Days by service.

The basic operation of exponential smoothing is used in forecasting Silas B. Hays Army Community Hospital calendar year 1992 Admissions and Bed Days. The New Estimate formula used is equal to the Old Estimate + A Fraction of the Error where:

- > The New Estimate represents the revised estimate of a forecasting model component after a new observation has been obtained and incorporated (the new estimate is derived from data collected in years 1987 through September 1991 with a predetermined error factor)[Ref. 16].

- > The Old Estimate represents the most recent value of the component before the new observation became available.

- > The Error is equal to the latest value of the component, as indicated by the most recent observation, minus the forecasted value for it made one period earlier (the old estimate).

- > The Fraction is equal to a value between zero and one which is termed the exponential smoothing constant; it determines the responsiveness of the revision system to new observations.

Only short-term forecasting is being performed in this thesis (calendar year 1992). The only question remaining is whether trend and/or seasonality exists. The possible answers

are neither exists, one or the other is present, or both occur. This results in four possible models:

1. Level Model
2. Level and Trend Model
3. Level and Seasonal Model
4. Level, Trend and Seasonal Model

When only short-term forecasting is being performed, the components of a time series requiring consideration are:

> Level which represents the long-run average or level component of a time series; it is the base component with reference to which the other components are defined. If the forecasting model fits into this category, it has been determined that the data collected can be averaged out to the projected year (in this case 1992).

> Trend which represents the per period change in the level which may be linear (constant) or nonlinear; in keeping with popular practice, we consider only a linear trend.

> Seasonal which is a recurring pattern about the level component or level and trend components, which may occur in response to natural or artificial forces; the seasons of the year are illustrative of natural forces, while regular sales promotions may induce an artificial seasonality into a time series.

> Random which is an unexplained period-to-period fluctuations in demand not due to any of the above effects.

Appendix C describes the input data used in the models forecasting the Bed Days and Admissions for 1992.

Two data items were required: a) the number of independent series investigated and 2) the largest number of observations to be entered. These two numbers were six (Army, Navy, Marine, Air Force, Coast Guard, and Other) and thirty-three (Jan 1989 through Sep 1991) respectively. The category

"Other" in this thesis includes personnel and dependents of personnel assigned to Public Health Service, National Oceanic & Atmospheric Administration, Civilian Employees, Other Beneficiaries and Foreign Nationals.

Below is a general description of the calculations performed with each of the data groups (Army, Navy, Marine, Air Force, Coast Guard, and Other):

> Initial Conditions - The earliest data are used to calculate initial values for the components of the forecasting model. In this case, January 1989 is the earliest data used because it is the most current data set where the active duty services usage in Bed Days and Admissions are separated. A minimum of $m+3$ periods (m being the length of the seasonal pattern) are used to make these initial estimates. A back-smoothing procedure is later applied to further improve the accuracy of the estimates. Back smoothing initially backs the model components to time 0 (zero), and then walks them through the data one period at a time, revising them by exponential smoothing.

> Model Fitting - The data from the next set of periods are used to test the forecasting ability of each of the four models using various smoothing constants. This will assist in the choosing of smoothing constants. The most effective model is then chosen. One smoothing constant, 0.2, was used for Trend, Level and Seasonal. The results for the extended forecasts for periods beyond September 1991 are listed in Appendices D & E.

> Model Validation - The observation used for initial conditions and model fitting are called estimation data. All other remaining data, referred to as prediction data, is used for validating the selected model. The validation model is used to forecast the observations, period by period (period 33 through 44). The smoothing constants are held fixed in this phase, and the estimates of the components are updated at

regular intervals to the planning horizon. The results are the output shown pictorially in Appendices D & E.

D. RESULTS OF FORECASTING MODEL

The Admission Model forecast results are summarized in Table VI. The number of personnel forecasted to be admitted into Silas B. Hays Army Community Hospital monthly in 1992 is broken down by service. The model selected for each service is listed below:

Army - "Level Model" because the model fitting error statistics were calculated to be the lowest (Root Mean Square Error = 19.59). The lowest error gives the more realistic forecast (highest 34.48).

Navy - "Level Model," Root Mean Square Error of calculated to be 10.80 (highest 15.21).

Marine Corps - "Level Model," Root Mean Square Error calculated to be 5.09 (highest 6.57).

Air Force - "Seasonal Model," Root Mean Square Error calculated to be 7.50 (highest 9.23).

Coast Guard - "Trend Model," Root Mean Square Error calculated to be 2.81 (highest 4.45).

Other - "Level Model," Root Mean Square Error calculated to be 6.49 (highest 7.08).

TABLE VI
 SILAS B. HAYS ARMY COMMUNITY HOSPITAL 1992
 ADMISSION FORECASTING MODEL RESULTS

Period	Army	Navy	Marine Corps	Air Force	Coast Guard	Other
Jan '92 P-33	124	66	11	52	3	12
Feb '92 P-34	124	66	11	24	3	12
Mar '92 P-35	124	66	11	48	2	12
Apr '92 P-36	124	66	11	32	2	12
May '92 P-37	124	66	11	37	2	12
Jun '92 P-38	124	66	11	34	2	12
Jul '92 P-39	124	66	11	33	2	12
Aug '92 P-40	124	66	11	39	2	12
Sep '92 P-41	124	66	11	38	2	12
Oct '92 P-42	124	66	11	23	1	12
Nov '92 P-43	124	66	11	21	1	12
Dec '92 P-44	124	66	11	34	1	12
TOTAL	1,488	792	132	415	23	144

The total admissions projected in Table VI is 2,994. The population breakdown of this number reflects that 49.7 percent of the remaining personnel requiring medical assistance will be Army, 26.5 percent Navy, 4.4 percent Marine Corps, 13.9

percent Air Force, 0.76 percent Coast Guard and 4.8 percent Other.

It should be noted that the actual number of Army personnel requiring medical services in 1992 would be slightly higher, due to the fact that the Defense Language Institute Army personnel were not identified separately from Fort Ord Army personnel in the utilization statistics.

The admission levels data was collected to forecast the number of personnel that requiring hospitalization in 1992. By evaluating the admissions data and forecasting the bed days required it was determined that the personnel remaining in Monterey would need 11,402 beds in 1992.

The Bed Days Future Forecasting Model (calendar year 1992) Results are summarized in Table VII. The model selected by service are identified below:

Army - "Seasonal Model," Root Mean Square Error 51.70 (highest 60.88).

Navy - "Trend-Seasonal Model," Root Mean Square Error 36.93 (highest 40.48).

Marine Corps - "Level Model," Root Mean Square Error 16.64 (highest 21.72).

Air Force - "Level Model," Root Mean Square Error 31.99 (highest 39.62).

Coast Guard - "Trend Model," Root Mean Square Error 6.67 (highest 12.60).

Other - "Level Model," Root Mean Square Error 18.76 (highest 25.01).

TABLE VII
SILAS B. HAYS ARMY COMMUNITY HOSPITAL 1992
BED DAYS FORECASTING MODEL RESULTS

Period	Army	Navy	Marine Corp	Air Force	Coast Guard	Other
Jan '92 P-33	521	210	38	97	7	32
Feb '92 P-34	611	175	38	97	7	32

Apr '92 P-36	501	178	38	97	6	32
May '92 P-37	698	182	38	97	6	32
Jun '92 P-38	521	196	38	97	5	32
Jul '92 P-39	623	175	38	97	5	32
Aug '92 P-40	563	213	38	97	4	32
Sep '92 P-41	647	190	38	97	4	32
Oct '92 P-42	555	227	38	97	4	32
Nov '92 P-43	555	241	38	97	3	32
Dec '92 P-44	551	235	38	97	3	32
TOTAL	6,932	2,406	456	1164	60	384

The total number of bed days required for 1992 is projected to be 11,402 days. The population breakdown of this number reflects that 61.0 percent of the beds needed will be used by Army personnel, 21.1 percent Navy, 3.9 percent Marine

Corps, 10.2 percent by Air Force, .53 percent Coast Guard and 3.4 percent Other.

There are approximately 81,679 bed days available in the Monterey area, per 1990 data (see Appendix F for calculations). CHOMP has a projected 11,781 excess bed days available (excluding the Recovery Center), Natividad Medical Center has an excess of 36,377 bed days (this figure includes the Extended Care Unit) and Salinas Valley Memorial Hospital has 33,521 bed days available. The 11,402 beds required by the remaining armed services can be easily accommodated by the current Monterey area hospitals. The distribution would be determined based on the medical requirements of the individual.

The Monterey Peninsula hospitals (CHOMP, Natividad, and Salinas Valley) have the resources and the facilities to accommodate the remaining military, however, none of these hospitals currently have a Champus contract. Since the Fort Ord Silas B. Hays Army Community Hospital and their Outpatient Clinics have been readily available, this has not been a problem. Negotiations would have to be made to enable the military and retirees access (government financed) to the local hospitals.

E. SILAS B. HAYS ARMY COMMUNITY HOSPITAL UTILIZATION STATISTICS

Silas B. Hays Army Community Hospital has seven outpatient clinics. Their current utilization statistics from 1989 thorough September 1991 were broken down by clinic and listed below [Ref. 17].

Outpatient Clinics:

Fort Hunter Liggett (F.H.L.)
Occupational Health Clinic (O.H.C.)
Troop Medical Confinement (T.M.C.)
Combined Troop Medical Clinic (C.T.M.C.)
Clinic Presidio of Monterey (P.O.M.)
Primus Clinic of Salinas (P.C.S.)
Primus Clinic of Monterey (P.C.M.)

TOTAL OUTPATIENT USAGE PER CLINIC:

	F.H.L.	O.H.L.	T.M.C.	C.T.M.C.	P.O.M.	P.C.S.	P.C.M.
'89	6,746	3,531	448	74,454	3,644	28,950	62,015
'90	7,385	3,284	497	78,796	2,514	28,576	67,031
'91*	6,491	2,807	277	53,074	2,232	22,454	48,129
	20,622	9,622	2,222	206,324	8,390	79,980	177,175

The closure of Fort Ord will cause a decline in the utilization statistics due primarily to the Active Duty Army military members and their dependents leaving the area. The Outpatient Clinics statistics are reported again below minus the Active Duty Army/their dependents.

TOTAL OUTPATIENT CLINICS:

	F.H.L.	O.H.C.	C.T.M.C.	P.O.M.	P.C.S.	P.C.M.
'89	1,446	3,431	2,923	1,517	12,797	27,611
'90	834	2,773	1,267	1,179	13,157	31,718
'91*	1,059	2,290	1,696	998	10,177	23,622
	3,339	8,494	5,886	3,694	36,131	82,951

The Troop Medical Confinement Clinic usage is primarily active duty army personnel only, therefore there no statistics are reported in this area.

The retirees and their dependents use the outpatient clinics often. Below are statistics showing their use.

First, their total outpatient usage is reported by clinics.
Second, the clinical reports are broken down by service.

TOTAL OUTPATIENT CLINICS:

	F.H.L.	O.H.C.	C.T.M.C.	P.O.M.	P.C.S.	P.C.M.
'89	1,135	-0-	1,668	-0-	10,053	4,532
'90	1,127	3	1,003	-0-	10,646	4,871
'91*	820	-0-	1,440	-0-	8,817	3,659
	3,082	3	4,111	-0-	29,516	13,062

RETIREEES/THEIR DEPENDENTS CLINICAL BREAKDOWN:

Fort Hunter Liggett Outpatient Usage:

'90	8,730	981	146	654	135
'91*	7,320	801	136	469	91
	24,292	2,674	410	1,805	335

Primus Clinic of Monterey Outpatient Usage:

	Army	Navy	Marine Corps	Air Force	Coast Guard
'89	2,974	1,038	119	369	32
'90	3,165	1,115	160	357	74
'91*	2,302	935	111	268	43
	8,441	3,088	390	994	149

SILAS B. HAYS ARMY COMMUNITY HOSPITAL:

Below are the retirees/their dependents data listing their admission, bed days, inpatient visits, and outpatient visits for 1989-September 1991 at Silas B. Hays Army Community Hospital.

Retirees and Their Dependents Total Usage (at Silas B. Hays Army Community Hospital):

	Admission	Bed Days	Inpatient	Outpatient
'89	2,159	7,799	8,017	81,154
'90	2,098	14,985	9,059	94,551
'91*	1,328	6,205	9,169	65,628
	5,585	28,989	26,245	241,333

The total personnel usage at Silas B. Hays Army Community Hospital (including the Active Duty Army/Their Dependents and the Retirees/Their Dependents) are listed below broken down by admission, bed days, inpatient visits and outpatient visits.

TOTAL PERSONNEL USAGE:

	Admission	Bed Days	Inpatient	Outpatient
'87	9,385	37,679	N/A	N/A
'88	10,572	37,357	N/A	N/A
'89	11,160	35,304	16,574	342,534
'90	10,653	36,472	17,573	360,872
'91*	7,396	25,764	16,120	373,955
	49,166	172,576	50,267	1,077,361

The information below exclude the Active Duty Army/Their Dependents:

	Admission	Bed Days	Inpatient	Outpatient
'89	3,294	11,141	8,694	102,968
'90	3,356	12,053	9,952	148,542
'91*	2,157	9,113	9,701	105,325
	8,807	32,307	28,347	356,835

The retirees and their dependents utilization statistics reported from Silas B. Hays Army Community Hospital. The first set of data represents the total admission, bed days, inpatient visits, and outpatient visits (from 1989- September 1991). The latter information is reported again broken down by service (Army, Navy, Marine Corps, Air Force, Coast Guard).

Retirees/Their Dependents Usage:

	Admission	Bed Days	Inpatient	Outpatient
'89	2,145	7,903	7,453	82,221
'90	2,074	8,322	8,476	96,620

* 1991 Data collected through September 1991.

F. MONTEREY COUNTY POPULATION GROWTH

The population growth rate for Monterey County is an estimated two percent increase per year. Therefore, the projected 1992 population in the county is 382,440. The local hospital increase in outpatient/inpatient statistics were adjusted (increased by two percent) to accommodate this factor. The 1992 adjustments are listed below:

<u>CHOMP:</u>	<u>1992</u>	<u>1995</u>	<u>2000</u>
A. Admissions	11,410	12,095	13,305
B. Patient Days	52,764	55,930	61,523
C. Outpatient Visits	131,994	139,914	153,905
D. Emergency Room Visits	32,905	34,879	38,367

<u>Natividad Medical Center:</u>	<u>1992</u>	<u>1995</u>	<u>2000</u>
A. Admissions	6,132	6,500	7,150
B. Patient Days	41,451	43,938	48,332
C. Outpatient/ER Visits	101,375	107,458	118,204

<u>Salinas Valley Memorial:</u>	<u>1992</u>	<u>1995</u>	<u>2000</u>
A. Admissions	10,872	11,524	12,676
B. Patient Days	51,065	54,129	59,542
C. Outpatient Visits	77,570	82,224	90,446
D. Emergency Room Visits	28,311	30,010	33,011

The two percent growth rate (per year) increases the excess beds available at the three hospitals for calendar years 1992, 1995 and 2000. The calculations are computed below:

CHOMP:

1992

Total bed days available per year	= 63,510
Total beds projected in 1992	= <u>52,764</u>
	10,746 Excess

1995

Total bed days available per year	= 63,510
Total beds projected in 1995	= <u>55,930</u>
	7,580 Excess

2000

Total bed days available per year	= 63,510
Total beds projected in 2000	= <u>61,523</u>
	1,987 Excess

Natividad Medical Center:

1992

Total bed days available per year	= 77,015
Total beds projected in 1992	= <u>41,451</u>
	35,564 Excess

1995

Total bed days available per year	= 77,015
Total beds projected in 1995	= <u>43,938</u>
	33,077 Excess

2000

Total bed days available per year	= 77,015
Total beds projected in 2000	= <u>48,332</u>
	28,683 Excess

Salinas Valley Memorial:

1992

Total bed days available per year	= 83,585
Total beds projected in 1992	= <u>51,065</u>
	32,520 Excess

1995

Total bed days available per year	= 83,585
Total beds projected in 1995	= <u>54,129</u>
	29,456 Excess

2000

Total bed days available per year	= 83,585
Total beds projected in 2000	= <u>59,542</u>
	24,043 Excess

The total excess beds computed to be available in 1992, 1995 and 2000 are 78,830, 70,113 and 54,713 beds respectively. Even with a two percent population increase per year the Monterey County can still accommodate the additional patients from Silas B. Hays Army Community Hospital requiring hospitalization. A summary of the growth rates are listed below:

	<u>1990</u>	<u>1992</u>	<u>1995</u>	<u>2000</u>
Total excess beds available=	81,679	78,830	70,113	54,713
Beds required by Silas (2% growth rate per year)	= <u>12,198</u>	<u>11,402</u>	<u>12,086</u>	<u>13,295</u>
Remaining Beds	= 69,481	67,428	58,027	41,418

The 1990 excess bed days calculations were computed earlier and are described in detail in Appendix F. The 1990 Beds required by Silas B. Hays Army Community Hospitals are the actual recorded amount minus the Active Duty Army personnel and their dependents. The remaining data are forecasts taking into consideration a normal two percent (yearly) growth rate.

V. CONCLUSIONS

This chapter presents the conclusions and results from the research and answers two questions:

1. Does the Monterey Peninsula have the medical facilities and capability to service the remaining active duty members, dependents and retired personnel if Silas B. Hays Army Community Hospital is recommended for full closure?

2. What alternatives for obtaining medical care are available to the remaining armed forces?

This chapter begins by first reviewing the forecasting models selected for calculating future admission and bed days. Second, the historical data for Silas B. Hays Army Community Hospital and seven outpatient clinics, including and excluding the active duty Army personnel and their dependents are summarized. The occupancy rates are recomputed showing their decreases. Third, the seven outpatient clinics are evaluated separately and conclusions are made concerning their future use (redistribution of outpatient care responsibility). Finally, the costs associated with inpatient care and CHAMPUS are mentioned.

Areas for additional research are suggested at the end of the chapter.

A. CONCLUSIONS

A forecasting model projecting Silas B. Hays Army Community Hospital 1992 admissions and bed day requirements was designed and applied, results of the analysis were examined and evaluated in Chapter III. Four models were examined: Level, Trend, Seasonal and Trend-Seasonal. A "best model" forecast was selected on the basis of highest forecast accuracy assumptions relative to historical trend data. The forecasting model composition is shown below:

<u>Armed Service</u>	<u>Model Selected</u>
Army (Admission)	Level
" (Bed Days)	Seasonal
Navy (Admission)	Level
" (Bed Days)	Trend-Seasonal
Marine Corps (Admission)	Level
" " (Bed Days)	Level
Air Force (Admission)	Seasonal
" " (Bed Days)	Level
Coast Guard (Admission)	Trend
" " (Bed Days)	Trend
Other (Admission)	Level
" (Bed Days)	Level

The total bed days forecasted to be needed in 1992 by Silas B. Hays Army Community Hospital using this composite model was calculated as 11,402. The excess bed days estimated to be available on the Monterey Peninsula in 1990 was 81,679 (Appendix VI). There are more than enough bed days available to service the remaining personnel and their families.

Silas B. Hays Army Community Hospital was originally authorized to be a 440 bed hospital. However, it currently uses 400 beds. The maximum amount of bed days available per year is 146,000 (See Appendix A). The hospital utilization data with the active duty Army personnel and their dependents included in 1989, made the hospital an average 3.163 bed days per patient. This figure equates to 35,304 total patient days/11,160 admissions. In 1990, the hospital average rose to 3.414 bed days per patient. This equates to 36,373 total patient days/10,653 admissions. The active duty Army and their dependents account for more than 85 percent of the hospital total customer population. They account for approximately 86 percent of Silas B. Hays Army Community Hospital total patient days, 84 percent of the total

admissions and 87 percent of the total outpatient visits for calendar year 1990.

The overall occupancy rate for Silas B. Hays Army Community Hospital in 1987, 1988, 1989 and 1990, with the active duty Army with their dependents included, was 25.8, 25.6, 24.2 and 24.9 percent respectively. Using the same historical data, but excluding the active duty army personnel and their dependents, the overall occupancy rate for 1989 and 1990 drops to 7.81 and 8.25 percent respectively (Statistics in Chapter III). Compared with the civilian hospitals on the Monterey peninsula, the occupancy rate for Silas B. Hays Army Community Hospital is exceptionally low. The local area hospitals average between 59 to 85 percent occupancy rate per year.

In evaluating the hospital outpatient statistics, it is clear that Silas B. Hays Army Community Hospital far exceeds the capacity at local hospitals in this area. The number of the hospital outpatient visits for 1990 was extremely high compared to the three local area hospitals. The hospital outpatient visits in 1990 totaled 360,872. The 1990 data for CHOMP represents only 36.8 percent of Silas B. Hays total outpatient visits, Natividad 27.5 percent and Salinas Valley 21.1 percent.

The outpatient visits data minus the active duty Army and their dependents would reduce the 1990 figure of 360,872 to 148,542 (a decline of 58.84 percent).

Unlike the three local hospitals, Silas B. Hays Army Community Hospital has seven additional outpatient clinics as tenant commands. The breakdown of outpatient visits per clinic are listed in Chapter III. The data for 1989 and 1990 (all seven clinic included) are 179,788 and 188,083 visits respectively. This data includes the active duty Army personnel and their dependents.

If the active duty Army and their dependents are subtracted from the seven outpatient clinics the total for 1989 and 1990 decrease to 49,725 (a decline of 72.34 percent) and 50,928 (a decline of 72.92 percent).

The Monterey Peninsula can support the outpatient visits if Primus Clinic Salinas and Primus Clinic of Monterey are maintained/kept open. These clinics are able to handle the overload of outpatient customers serviced by Silas B. Hays Army Community Hospital.

The Primus Clinic of Salinas averages approximately 28,000 outpatient visits per year. This figure includes active duty Army and their dependents. However, if the above group was excluded, the average outpatient visits decrease to 13,000 per year. Therefore, some of the outpatient flow can be redirected to this clinic.

The Primus Clinic of Monterey averages approximately 63,000 outpatient visits per year. If the active duty Army and their dependents were excluded the average would decrease to 29,000 outpatient visits per year. Once again, additional outpatient clientele could be redirected to this particular clinic.

In further evaluating the clinics, it has been determined that the closure of Fort Ord would reduce the Troop Medical Confinement Clinic outpatients customers would drop to zero. Only Army personnel in confinement use this particular clinic. Therefore, no redirection of patients are required.

The Occupational Health Clinic patronage in 1989 and 1990 totaled 3,531 and 3,284 respectively. This data includes active duty Army personnel and their dependents. Excluding the above personnel reduces this figure 3,431 in 1989 (3 percent decrease) and 2,877 (12 percent decrease). This is not a significant change. The chief users of this clinic are civilian-DoD authorized employees.

The Combined Troop Medical Clinic reported a 1989 and 1990 outpatient visits totalling 74,454 and 78,796 respectively. This figure includes the active duty Army and their dependents. The figure decreases to 2,923 in 1989 and 1,267 in 1990, when active duty Army and their dependents are excluded. This represents an astronomical decline in of 96.07 percent in 1989, and 98.39 percent in 1990. The main users of this particular clinic are active duty Army and their dependents.

The Fort Hunter Liggett Clinic 1989 and 1990 outpatient visits was 6,746 and 7,385 respectively. This figure includes the active duty Army and their dependents. Excluding the active duty army and dependents, the data decreases to 1,446 for 1989 (78.56 percent decline) and 834 for 1990 (88.71 percent decline). The principal users of this clinic are the active duty personnel and their dependents. It has not been determined whether or how many of this population will remain in this location after the closure of Fort Ord. Therefore, the status of this clinic for closure or realignment of outpatients is unclear.

Finally, the Clinic Presidio of Monterey outpatient clinic reported in 1989 and 1990 data of 3,644 and 2,514 respectively. This figure includes active duty Army and their dependents. Excluding these personnel, this figure decrease to 1,517 (58.37 percent decline) in 1989 and to 1,179 in 1990 (53.10 percent decline). The highest users of this clinic are active duty Army, Navy, Air Force, and Marine Corps (no Coast Guard data was recorded). This clinic is able to receive outpatients from Silas B. Hays Army Community Hospital.

It should be noted that the data for the active duty Army personnel stationed at the Defense Language Institute and Fort Hunter Liggett could not be broken out separately from the data collected for Silas B. Hays Army Community Hospital. The Monterey Peninsula has the facilities, capabilities and

the available bed space to service and support the medical requirements of the remaining military personnel, their dependents, retirees and their families.

Some of the outpatient visits can be handled by the local area hospitals. Two of the seven Silas B. Hays Army Community Hospital outpatient clinics should be maintained to assist and offset the additional requirements placed on the hospitals.

The medical services available to the personnel stationed in the area will remain unchanged. However, the locations for these services change. The closure of Silas B. Hays Army Community Hospital will mean the convenience of the hospital as a one-stop medical service facility will no longer be available. Personnel requiring inpatient medical care will be redirected to a local area hospital or government facility. The outpatient care can be directed to the nearest available hospital or clinic.

Inpatient care will depend on which hospital has the available facilities and what particular medical service is required. CHAMPUS cost coverage will play a major role if Silas B. Hays Army Community Hospital is closed. The three local hospitals in this thesis are not currently under a CHAMPUS contract. The cost for the Monterey area reported by CHAMPUS from January 1990 through December 1990 for the government during this period was \$9,567,472. This cost is not totally inclusive because claims for CHAMPUS are accepted after December 1990. The cost of CHAMPUS is expected to rise if Silas B. Hays Army Community Hospital is closed, due to the simple fact that more service members will have to seek medical support from civilian hospital facilities vice using a government facility. The costs for CHAMPUS will depend on what medical services are provided and the hospital the member receives treatment. The decision must be made whether or not it is worth keeping Silas B. Hays Army Community Hospital open to defray the cost of outside medical care.

Secretary of Defense Dick Cheney summarized base closing best when he said "closing bases has become an economic necessity for the military. As defense spending decreases and the military shrinks, it is essential that we reduce the number of installations if we are to get the greatest value from a declining Defense Budget" [Ref. 18] .

The consequences of the closure of Fort Ord and Silas B. Hays Army Community Hospital will definitely affect the Monterey Peninsula and the remaining service members, dependents and retirees. The local area hospitals will have to assist/support the additional medical requirements of the military.

B. AREAS FOR FURTHER STUDY

Potentially productive areas for additional research arising out of this study include a number of topics. Additional research is recommended as follows:

1. Examine the various health care areas at Silas B. Hays to determine the most frequent services required. Evaluate local hospitals to determine if the services can be provided. Estimate the financial implications to the potential patient of obtaining these services.
2. Evaluate the full financial implications of closing of Silas B. Hays Army Community Hospital, e.g., is it cost effective to keep it open given the demand data developed in this thesis?
3. Evaluate the CHAMPUS requirements in relationship to the local area hospitals (CHOMP, Natividad, and Salinas Valley) to determine if it is feasible for the DoD and these facilities to pursue contracts for services?

C. CONTRIBUTION OF THE STUDY

This study contributes data and analysis relevant to the issue of whether Silas B. Hays Army Community Hospital should be closed or kept open. The answer to this question is not simple. Applying the utilization statistic estimations, the Army may no longer be able to afford to be the primary users of the hospital. The new primary users in order of significance is projected be the Navy, Air Force, Marine Corps, Army and perhaps the Coast Guard. Services for military retirees and their families will remain stable as long as the current medical support that Silas B. Hays (location/convenience/cost) afforded them is maintained. To fully answer the question of closure, other issues should be examined as listed under areas for additional research. If the decision were based strictly on the estimated utilization statistics for the remaining area armed services as forecasted in this thesis, then Silas B. Hays Army Community Hospital would be closed. Residual personnel medical requirements could be handled by the local area hospitals given the availability of financing to support this arrangement.

Total Patient Days for 1990 = 5,807

Computed Occupancy Rate = $5,807/31,390 = 18.5 \%$

Natividad Medical Center:

Authorized Beds 211

Number of Days in a Year \times 365

77,015 Total Bed Days Per Year

Total Patient Days for 1990 = 40,638

Computed Occupancy Rate = $40,638/77,015 = 52.8 \%$

Salinas Valley Memorial Hospital:

Authorized Beds 229

Number of Days in a Year \times 365

83,585 Total Bed Days Per Year

Total Patient Days for 1990 = 50,064

Computed Occupancy Rate = $50,064/83,585 = 59.9 \%$

APPENDIX C

FORECASTING MODEL INPUT VALUES

1. Types of Data Values - This indicates whether the observations to be entered are in the form of integers or real numbers with decimal parts. In the model used the data are integer-valued, therefore, forecasts are rounded-off to the nearest integer.

2. Range of Data Values - This indicates whether the series is entirely made up of positive numbers, entirely negative numbers, or a mixture of both. Positive numbers are used in this forecasting model.

3. Length of Seasonal Pattern - The length of time to repeat any seasonal pattern. In this case twelve was chosen to accommodate monthly data.

4. Number of Periods to be used for Model Validation (Model Val)
- To explain this parameter, we must go a little deeper into the functioning of the module. The series of observations are divided into three groups, to be used for Initial Conditions, Model Fitting and Model Validation. The value chosen for model val is $m+4$ (m represents the length of the seasonal pattern).
